

Kubernetes Platform Economics Workshop 5

Scenarios, Recommendation, and 90-Day Plan

[DATE]

[FACILITATOR]

Where We Are

Tracking our progress across the full workshop series — you are here at Workshop 5.

What We Are Producing Today

By the end of this session we will have five concrete outputs ready for leadership.

01	02	03
Workload Placement Matrix	Scenario Comparison	Recommendation
Which workloads belong where and why — scored and documented.	Four options evaluated on cost, value, risk, and time to value.	Evidence-based, with trade-offs clearly stated.
04	05	
90-Day Plan	Decision Brief Outline	
No-regrets actions, decisions required, and pilots.	Ready to populate for the executive audience.	

The Full Picture — A Quick Review

A summary of what each workshop produced — the foundation for today's scenarios and recommendation.

Cost Baseline

What the estate costs today

- Total: [AMOUNT]
- [KEY METRIC] = [VALUE]

Unit Economics

Cost per useful outcome across six buckets

- [KEY METRIC] = [VALUE]

Showback View

Cost by team or namespace

- [TOP TEAM] = [AMOUNT]
- [NEXT TEAM] = [AMOUNT]

Value Scorecard

[NUMBER] measures across delivery, reliability, security, and developer experience

How We Compare Scenarios

Every scenario is assessed against the same four dimensions to ensure a fair, evidence-based comparison.

Cost Impact

Hard savings, cost avoidance, capacity release, and toil reduction — quantified where possible.

Value and Risk Impact

Assessed against the scorecard — delivery, reliability, security, and developer experience.

Time to Value

Realistic estimate — not best case. Accounts for migration complexity and organisational readiness.

Dependencies and Constraints

What needs to be true for this scenario to work — assumptions surfaced and documented.

Workload Placement Matrix — The Criteria

Before we compare scenarios, we need to know where each workload actually belongs. Six criteria — scored **High**, **Medium**, or **Low** per workload.

Compliance and Policy Intensity

How much policy enforcement and audit evidence does this workload need?

Cloud-Native Coupling

How tightly is this workload coupled to provider-specific services?

Operational Burden

How much day-two effort does this workload generate?

Portability Need

Does this workload need to move between platforms or clouds?

Migration Complexity

How difficult and risky would moving this workload be?

Data Gravity and Latency

Are there performance or data residency constraints pinning this workload?

Workload Placement Matrix

Score each workload against the six criteria live in this session. **H = High | M = Medium | L = Low**

Workload	Compliance Intensity	Cloud-Native Coupling	Ops Burden	Portability Need	Migration Complexity	Data Gravity
[WL 1]						
[WL 2]						
[WL 3]						
[WL 4]						
[WL 5]						
[WL 6]						
[WL 7]						
[WL 8]						
[WL 9]						
[WL 10]						

 Score: H = High | M = Medium | L = Low — populate live during the session

Placement Matrix — What It Tells Us

The matrix results sort workloads into four categories, each with a clear implication for the scenario comparison.

Consolidation Candidates

[WORKLOADS — POPULATE FROM MATRIX]

Justified Exceptions

[WORKLOADS — POPULATE FROM MATRIX]

Documented reasons required for each.

Managed Platform Candidates

[WORKLOADS — POPULATE FROM MATRIX]

Spike Candidates

[WORKLOADS — POPULATE FROM MATRIX]

Needs further investigation before placement decision.

Scenario A — Optimise the Current Estate

LOW RISK

4–12 WEEKS

What Changes

Utilisation improvement, cluster sprawl reduction, resource rightsizing, autoscaling, and tooling consolidation where duplication exists. **No structural change** to the platform estate.

Cost Impact

- Hard savings: [POPULATE]
- Cost avoidance: [POPULATE]
- Capacity release: [POPULATE]
- Toil reduction: [POPULATE]

Value and Risk Impact

[POPULATE FROM SCORECARD — which measures improve?]

Time to Value and Risk

4 to 12 weeks (optimisations) / 1 to 2 quarters (consolidation). **Risk: Low** — no structural change, benefits are incremental.

Scenario B — Consolidate Workloads Across Platforms

MEDIUM RISK

1-4 QUARTERS

What Changes

Consolidation candidates from the placement matrix migrate to a preferred platform. Tooling, policy, and operational duplication is reduced. The estate becomes more intentional.

Cost Impact

- Hard savings: [POPULATE]
- Cost avoidance: [POPULATE]
- Capacity release: [POPULATE]
- Toil reduction: [POPULATE]

Value and Risk Impact

[POPULATE FROM SCORECARD — which measures improve or worsen?]

Time to Value and Risk

1 to 2 quarters (tooling) / 2 to 4 quarters (migration). **Risk: Medium** — migration introduces short-term risk.

Scenario C — Move to Managed Kubernetes

LOW-MEDIUM RISK

1-4 QUARTERS

What Changes

Selected clusters or workloads move to a managed Kubernetes offering. Control plane management, upgrades, and infrastructure reliability shift to the managed service. Platform team capacity is redirected.

Cost Impact

- Hard savings: [POPULATE]
- Cost avoidance: [POPULATE]
- Capacity release: [POPULATE]
- Toil reduction: [POPULATE – ops effort for upgrades and patching]

Value and Risk Impact

[POPULATE FROM SCORECARD – reliability, security, ops burden]

Time to Value and Risk

1 quarter (pilot) / 2 to 4 quarters (broader migration). **Risk: Low to Medium** – mature offering, risk in migration period.

Scenario D — Hybrid Portfolio

MEDIUM RISK

1-4 QUARTERS

What Changes

The estate is structured deliberately. Justified exceptions stay where they are with documented reasons. Consolidation candidates migrate. The estate is intentional — not sprawling.

Cost Impact

- Hard savings: [POPULATE]
- Cost avoidance: [POPULATE]
- Capacity release: [POPULATE]
- Toil reduction: [POPULATE]

Value and Risk Impact

[POPULATE FROM SCORECARD]

Time to Value and Risk

1 quarter (governance model) / 2 to 4 quarters (consolidation). **Risk: Medium** — governance overhead required to prevent drift.

Scenario Comparison

All four scenarios assessed across the same four dimensions — populate live during the session.

Dimension	Scenario A — Optimise	Scenario B — Consolidate	Scenario C — Managed K8s	Scenario D — Hybrid
Cost Impact	[POPULATE]	[POPULATE]	[POPULATE]	[POPULATE]
Value and Risk	[POPULATE]	[POPULATE]	[POPULATE]	[POPULATE]
Time to Value	4–12 weeks	1–4 quarters	1–4 quarters	1–4 quarters
Risk	Low	Medium	Low–Medium	Medium
Key Dependency	Governance rules	Placement readiness	Landing zone readiness	Placement rules + governance

The Recommendation

Populated live in session — evidence-based, with trade-offs clearly stated and key assumptions surfaced.

Recommended Path

[POPULATE IN SESSION]

Why This Path

[POPULATE IN SESSION]

Trade-offs We Are Accepting

[POPULATE IN SESSION]

What Would Change This Recommendation

[POPULATE IN SESSION — key assumptions it depends on]

90-Day Plan — Track 1 — No-Regrets Actions

✔ Start these now — they improve the situation regardless of which scenario is chosen.

Action	Owner	Timeframe	Expected Outcome
[ACTION]			
[ACTION]			
[ACTION]			
[ACTION]			
[ACTION]			

90-Day Plan — Track 2 — Decisions Required

 Leadership needs to make these decisions before the preferred scenario can be fully committed to.

Decision	Who Decides	By When	Options
[DECISION]			
[DECISION]			
[DECISION]			

90-Day Plan — Track 3 — Pilots and Spikes

 Time-boxed investigations to validate key assumptions before committing to structural change.

Pilot or Spike	Scope	Success Criteria	Timeframe	Owner
[PILOT / SPIKE]				
[PILOT / SPIKE]				
[PILOT / SPIKE]				

Decision Brief — What Goes to Leadership

Audience: **[CIO]** | **[GM Tech and Ops]** | **[Finance]** | **[Procurement]** — Draft by: **[DATE]**

01	02	03
Executive Summary	Methodology	Cost Baseline
What we assessed, key findings, recommended path.	Frameworks used, confidence levels, assumptions.	TBM-aligned baseline, fixed vs variable, key drivers.
04	05	06
Unit Economics	Value Scorecard	Scenario Comparison
Three to five metrics with baselines and meaning.	Eight to twelve measures with baselines and targets.	Four scenarios on cost, value, risk, and time to value.
07	08	09
Recommendation	90-Day Plan	Appendix
Recommended path, rationale, trade-offs.	No-regrets actions, decisions required, pilots.	Assumptions register, data sources, sensitivity notes.

What We Have Built

Five workshops. One complete picture. The decision brief brings it all together for leadership, Finance, and Procurement.

Next Steps

Three clear actions to move from workshop outputs to leadership decision.
